## User Guide for the Space Lists

Space lists are used to document the requirements for the various rooms, spaces and functional components that are required for a new building. A large project will include numerous individual space lists. Each space list includes an itemized list of rooms and/or activity areas that are related by function, organizational structure, or by common location needs.

The space list includes a variety of information about each individual room or activity area, including the name of the space, the required size, the quantity of similar spaces, the number of people using the space, and general notes about any specific design requirements. Other columns provide codes that link individual items or groups of spaces to room data sheets or adjacency diagrams.

### Spatial Calculations

**Net Area.** The amount of space necessary for an individual room or functional area to appropriately accommodate the work activities occurring in it is identified as usable net area, and is expressed as net square feet (NSF). The net area is multiplied by the quantity that is needed and calculated as “Total NSF.” Groups of rooms or functions that are related operationally are subtotaled together as a “functional group.”

**Gross Area.** The gross area is the total amount of building area that is required to house all of the functions within the building. In order to calculate the total amount of building space needed, a two-step calculation process is required to convert net area to gross area (GSF).

Departmental Factor is a multiplier that includes the space needed for walls and other structural components within the work area. It also accounts for all the circulation space necessary for people and materials to move around within the work area (e.g., the aisles between modular workstations). The departmental factor varies, and is directly related to the type of activities in a specific work area.

Building Factor is a multiplier that includes the overall building structure and all the support areas required for the operation of the building (e.g. mechanical rooms, stairwells). It also includes all the circulation space between work areas. Application of this multiplier results in the Total Building Area for each space list.

### SPACE LIST DEFINITIONS

**NSF (Net Square Feet):**

*The usable area within a room or space.*

**GSF (Gross Square Feet):** *The total area that includes both the usable space (NSF) and required building structure and circulation needed to support that usable space.*

**Departmental Factor:**

*A multiplier that accounts for the typical amount of circulation space required for corridors and the movement of people, goods and services. This number varies by the type of function (e.g., offices, medical clinics, kitchens, warehousing, etc.).*

**Building Factor:**

*A multiplier that accounts for building structure, mechanical and electrical rooms, vertical circulation (stairs and elevators), and internal horizontal circulation (corridors between housing units, departments, etc.).*

## Organization of the Space Lists

The space lists included in this document are organized by Jail Plan Option. Within each Option, the space lists are organized by the County of Los Angeles Department primarily responsible for specific types of inmate housing and treatment programs:

- **Department of Mental Health (DMH)**, providing both inpatient and outpatient mental health treatment.
- **Department of Public Health (DPH)**, providing substance use disorders (SUD) treatment.
- **Los Angeles Sheriff's Department (LASD)**, providing general population high-security and medical outpatient specialty housing.
